

Republic of Peru

I-2

Putting an End to the Use of Artificial Intelligence in Modern Warfare

Policy Speech:

My fellow delegates, Resolution 1-2 gives only three people, all from Peru, control over our AI capabilities for combat and defense. This poses a severe security threat, but even if we were to dangerously turn a blind eye, the resolution naively assumes that the UN will be able to access all of SpaceX's satellites, which is highly improbable given that SpaceX is a private company. I've yet to mention the most glaring flaw in this resolution; SpaceX satellites are used to provide internet services, not geographic surveillance. This makes them entirely inept to survey the use of AI in warfare, even if the UN could secure a contract with SpaceX. For these deep-rooted reasons, in addition to implementing punishments that the First Committee has absolutely no right to implement, we cannot support this resolution under any circumstances if we hope to preserve our security.

Key Points:

- SpaceX satellites are used for internet connectivity, not for geographic surveillance, making them incapable of surveying the use of AI in warfare
- Giving complete control over reviewing the deployment of AI to one nation is grossly irresponsible and dangerous
- It's very unlikely that SpaceX will grant the UN access to any of its satellites.
 - Further, it's nearly impossible that it will give access to all of its satellites
- Still, besides the confidential satellites that have been manufactured for the US military, SpaceX's fleet is entirely comprised of internet satellites
- DISEC cannot impose fines for non-compliance
- Even if DISEC could impose fines, amounts of 25-150 million USD are astronomical
- The resolution wants to completely ban the use of autonomous AI systems in combat
 - Why should systems like these which often prevent unnecessary civilian casualties be subject to additional restrictions beyond what is stated in preexisting UN treaties?

The State of Israel

I-3

Diminishing Artificial-Intelligence-Powered Weapons in Initial Offensives

Policy Speech:

Resolution 1-3 include some important measures regarding Lethal Autonomous Weapons Systems, however, some amendments must be made to ensure the safety of this resolution. I applaud the Imperialist Satellite State, which some nations may refer to as Israel, for establishing a specific working definition of a LAW System and for drawing attention to the use of these systems for non-retaliatory purposes in armed conflict zones. Unfortunately, the resolution contradicts itself by stating the positive effects of LAWS, including reduced civilian casualties and improved accuracy, and later proclaiming that they hope to eliminate all LAW Systems within 15-25 years, and later want to ban AI in combat entirely. I implore the author of this paper and other delegates to discuss further how we might improve this resolution because the Imperialist Satellite State dangerously uses AI in their combative capabilities with the Iron Dome, so this last statement puts us all in imminent danger.

Key Points:

Positive:

- They established a clear and specific definition of LAWS
- They bring crucial attention to the use of LAW Systems for non-retaliatory purposes in active conflict zones

Negative:

- They didn't establish who specifically would be a member of *detectives*
- They hope to ban LAWS in all instances instead of strictly for initial offenses
- They hope to entirely ban the use of AI in warfare
- Israel hopes to ban LAWS/AI, but they use them in the form of the Iron Dome and Arrow
- Requires non-compliant state to pay a fine; DISEC does not have the authority to do this

The French Republic

1-4

Managing the Use of Iranian Shahed Drones in the Russia-Ukraine War

Policy Speech:

I'd like you to imagine an apocalyptic reality where nations are punished for simply defending themselves. Sadly, we won't have to imagine if this resolution is passed. Resolution 1-4 wants to punish Iran for supplying Russia with groundbreaking AI defense technologies that allowed Russia to defend itself from Ukraine. Further, this resolution hopes to place sanctions on a private Iranian company, however, DISEC nor the UN has the power to place sanctions on a private entity. Lastly, France hopes to implement a drone detection system in Ukraine, but a nearly identical system already exists, meaning there's no reason to request nearly 50 million dollars in funding. I urge the delegate representing France and any others who may support this resolution to explain why they specifically want to monitor Iranian drones. We can't allow the French Republic to place uncalled-for surveillance on Iranian drones because it's setting a precedent of surveillance without evidence. If they do this to Iran, any other nation could be their next target, which is why we must not support this resolution.

Key Points:

- The drones that Iran supplied to Russia were purely used for defensive measures
- DISEC nor the UN can impose sanctions on a private company
 - DISEC can't impose any sanctions
- There's inadequate evidence to prove that there should be specific surveillance on Iran
- There's already a drone defense system in Ukraine that is very similar to the proposed *AirGuard Defense System* so the requested 50 million dollars in funding is futile
 - The World Bank only gives loans for humanitarian purposes, so they likely wouldn't provide funding for the defense system even if it didn't already exist
- Referenced resolution A/C.1/78/L.56 in the preambulatory clauses hopes to impose additional restrictions on LAWS beyond what's placed on all other types of weapons
 - Why should there be additional restrictions placed on LAWS when they have been proven to have increased accuracy and decreased civilian casualties?

Key Points of Topic I Committee Discussion

- Article 51 of the United Nations Charter states that every state has an inherent right to self-defense, and LAWS and other combative weapons that use AI are a critical component of self-defense for many nations, including North Korea
 - NATO already has “clear pathways” to implement AI-enabled LAWS, so imposing additional restrictions on the use of LAWS puts adversaries in grave danger
 - South Korea (Chosun) uses LAWS for self-defense, so North Korea must also be able to use LAWS to protect itself
 - Continued conflict with the United States, a nation that has no LAWS regulations, also poses a massive threat to the security of North Korea, further emphasizing why LAWS and AI-enabled combat and weapons are necessary
- The Convention on Certain Conventional Weapons clearly states that prior humanitarian law, such as the Geneva Convention, also applies to autonomous weapons systems, meaning that additional regulation on LAWS is unnecessary and violates previous conventions
 - Further, these conventions have repeatedly been ineffective due to compliance issues, corrupt political motivations, and selective compliance
 - An example of this is how Saudi Arabia uses cluster munitions in the Syria civil war despite international condemnation
 - We shouldn’t establish additional treaties and conventions since the pre-existing ones are ineffective and foster conflict and disobedience
- The basic principles of sovereignty and non-interference with domestic issues are violated if there’s increased surveillance over LAWS and other AI-enabled systems
 - There are major security concerns with increased surveillance
 - Increased surveillance is a violation of a state’s right to privacy
- DISEC nor any other General Assembly committee has the authority to impose any form of a sanction or fine on any state, company, person, or group whatsoever
 - They also don’t have the authority to pass any legally binding laws or regulations
