

Topic: European Energy Crisis

Committee: ECOFIN

Sponsors: China, Latvia, United Kingdom

Signatories: Belgium, Canada, Indonesia, Iran, Netherlands, Russia, Saudi Arabia, Sweden, United States, Qatar

F.R.I.E.N.D.S.: Foreign Resources Integrated for Economic Nourishment and Development Success

THE GENERAL ASSEMBLY,

Affirming the need for LNG and nuclear power for immediate relief in Europe

Emphasizing the importance of balancing short-term fossil fuel solutions with long-term renewables

Keeping in mind the inability of smaller countries to invest in renewable energy immediately

Seeking an efficient energy system utilizing development technologies such as AI-driven smart grids that can reduce energy losses by up to 10-15%

1. Calls upon the expansion and utilization of LNG imports as an immediate solution to address Europe's urgent energy needs;
 - a. Encourages the formation of regional partnerships to develop and enhance LNG infrastructure and interconnectivity;
 - b. Establishes shared energy storage and distribution networks across the EU to strengthen energy resilience, and prevent overreliance on any single supplier;
 - c. Acknowledge the challenges faced by smaller European countries in transitioning to renewable energy and emphasize the need for tailored solutions, including short-term reliance on LNG, while working towards long-term renewable energy integration;
2. Emphasizes the need for countries with preexisting nuclear infrastructure to use these resources to resolve short-term crises
 - a. Provide a consistent source of power to electrical grids using nuclear fission without causing CO₂ emissions to skyrocket;
 - b. Preventing the need for new infrastructure that would divert time and funds away from renewable energy projects;
 - c. Be a short-term solution to energy scarcity without a long-term investment;
3. Recommends the use of energy efficiency to implement short-term solutions effectively
 - a. Reduce transmission losses, optimize storage, and adopt cutting-edge technologies to better ensure the creation of LNG;
 - i. Newer technologies like the "mixed refrigerant process" are designed to achieve higher efficiency by optimizing the cooling process;

4. Supports the creation of the EU Renewable Energy Investment Fund;
 - a. The fund will provide grants and loans to facilitate the green transition
 - b. This fund will prioritize large-scale wind, solar, and biomass projects, accelerating the adoption of renewable energy across the EU;
 - c. Funding will come from private investors and contributions based on GDP;
 - i. Private investors will include the Green Climate Fund, the World Bank, and the European Investment Bank
5. Establishes the UN Energy Expertise Programme (UNEEP);
 - a. A central oversight program to ensure the UN is moving towards a renewable future and preventing fallback on LNGs;
 - b. By deploying expert panels to discuss solutions for the UN to member states in need, starting in Europe;
 - c. Provides not just immediate support but focus on the renewable future;
 - d. Funding will come from the EU Renewable Energy Investment Fund
6. Designates the creation of the *EU Foreign Innovation Programme* (EUFIP) to increase domestic and foreign investments in renewable energy research & development, manufacturing, and deployment & construction;
 - a. Establish factories in Central and Eastern Europe (CEE) that manufacture traditional renewable energy products including solar panels and wind turbines;
 - i. These renewable energy products will be constructed in strategic locations across Europe that are either exposed to large amounts of UV rays or contain high amounts of wind energy;
 - b. Foster a knowledge transfer program that creates a means of open communication between Asian and other manufacturers and the European nations that are importing renewable energy technologies;
 - c. Launch education programs to upskill unemployed and underskilled Europeans who are interested in electrical engineering;
 - i. These programs will offer financial aid to under-represented populations and people facing poverty (energy, financial, or any other means of poverty);
 - ii. This program will target young adults aged between 18 and 30 and will take place online;
 - d. Construct five new research institutes across the European continent, emphasizing historically poorer industrial nations in CEE such as Poland and Hungary;
 - i. Research hyper-localized renewable energy technologies that maximize the specific resources of each European nation;
 - ii. Utilize private partnerships to accelerate innovation with LNG energy storage and renewable energy technologies;
7. Strongly affirms the inclusion of innovative renewable technologies into the European green transition;

- a. Launches a pilot project that will begin to implement smart electrical grids that leverage China's advanced artificial intelligence capabilities in underdeveloped CEE countries;
 - b. Should this project be successful, China will work further with the UN and other developed nations to fully implement these AI power grids into the entire European continent;
 - c. Increase investment and deployment of hydrogen and biomethane;
 - i. Leverage EU and Chinese technology;
- 8. Supports the gradual removal of tariffs on EV & Lithium Ion batteries imported from China;
 - a. The UN will partner with the WTO to set minimum prices to minimize the impact of Chinese subsidies;
- 9. Proclaims that these measures will be completed in a time-sensitive manner with a reasonable budget;
 - a. Requests \$5 billion dollars to minimize the short-term effects of energy poverty in Europe;
 - i. Infrastructure projects will be completed by December 31st, 2025;
 - b. China, the EU Development Bank, and UNICEF will fund the online education campaigns with \$10 million in funding to pay for staffing and curriculum development;
 - i. They will begin enrolling by July 1st, 2025;
 - c. The UN will leverage funding from the UN Energy Compact to integrate traditional and non-traditional renewable energy sources into Europe;
 - i. Funded with \$200 billion;
 - ii. Will be fully completed by January 1st, 2027;
 - d. LNG and nuclear energy will cease to be used by 2040;
 - e. Allocates \$2 billion to make dwellings efficient by January 1st, 2026;
